

The background features a complex, abstract composition of overlapping, semi-transparent shapes in shades of red, pink, and grey. The shapes vary in size and orientation, creating a sense of depth and movement. A prominent red star-like shape is visible in the upper right quadrant. The overall aesthetic is modern and graphic.

INTEROPERABILITY SPANS SEVERAL LEVELS

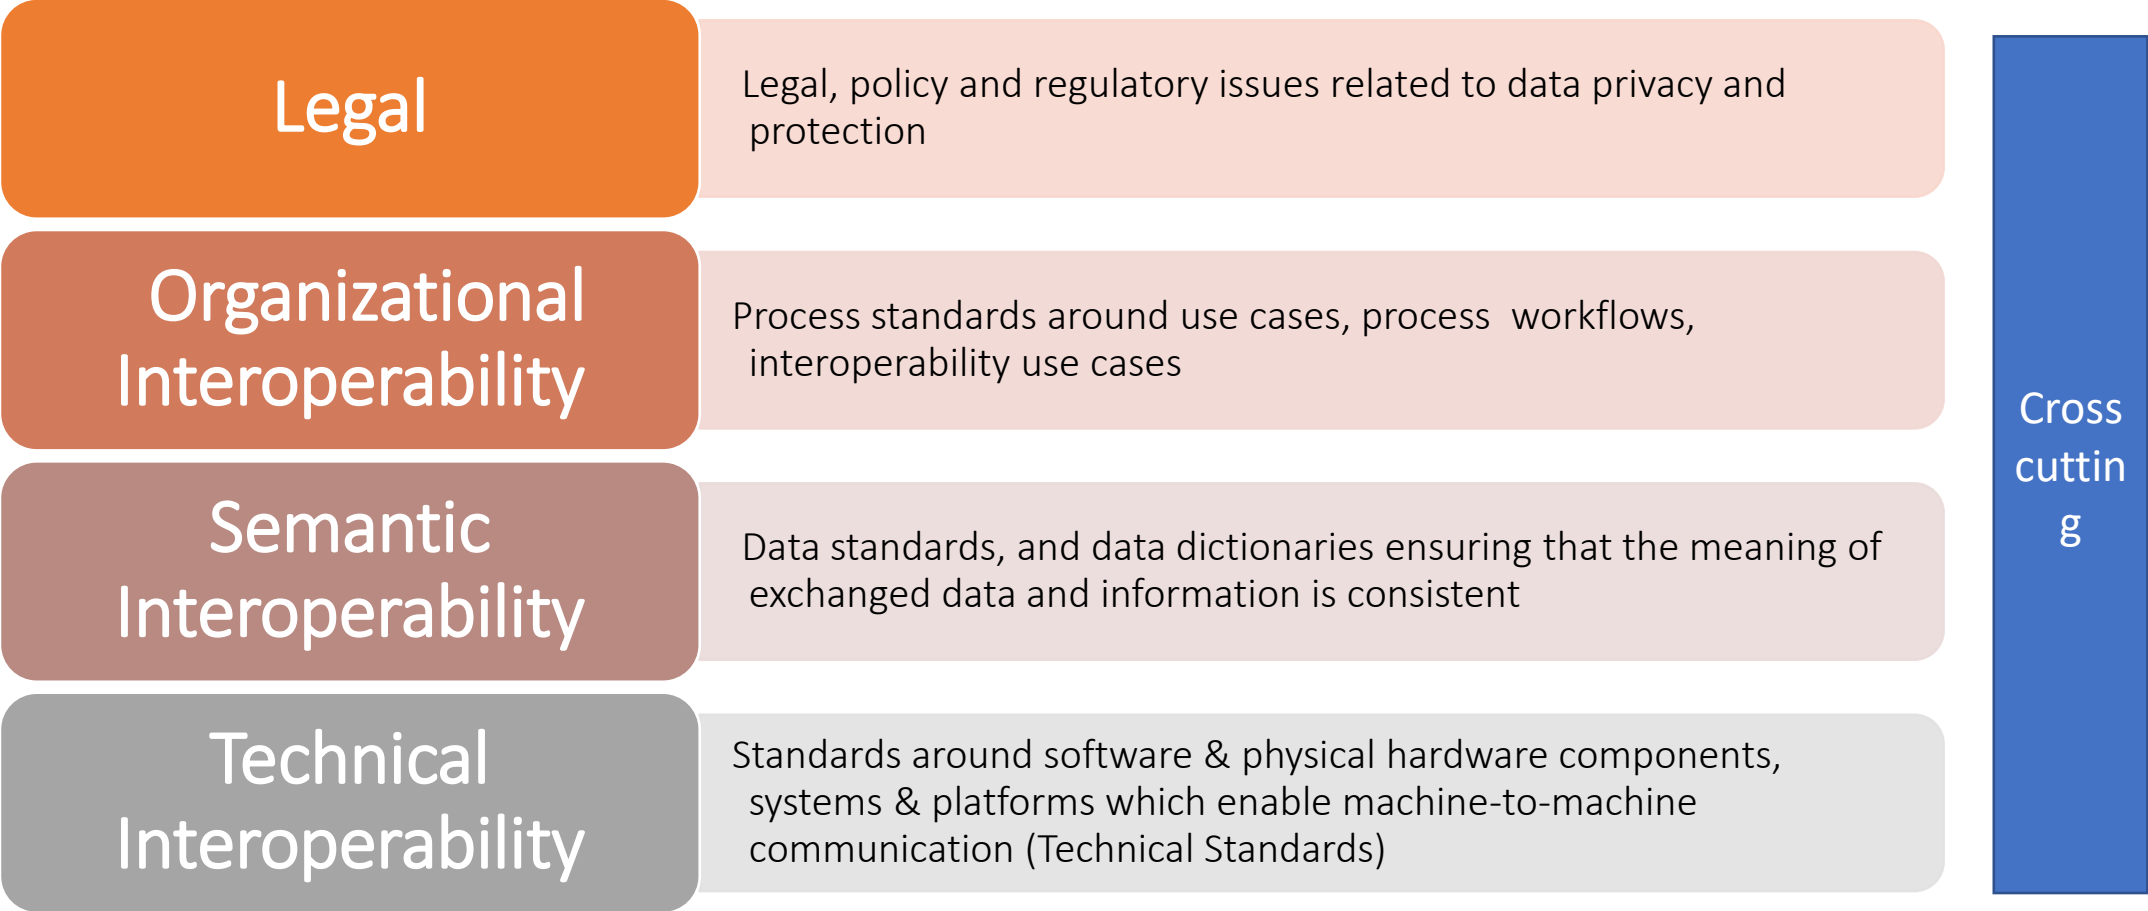

The Interoperability Frameworks, such as the European, the Estonian (and the US-SEI) comprise these dimensions, often focusing on the Legal, Organizational, Semantic and Technical interoperability.

EU interoperability framework

Figure 3 Interoperability Model

Interoperability Framework— standards needed across all layers to develop interoperable Systems

Path to convergence

Phase I (Sep 2021 – Dec 2021)

- Establish a set of drafting groups to start building artefacts to address most common high-priority needs
- Understand the breadth of needs at the country-level to develop a long-term roadmap
- Map guidance that already exists to meet country-level needs

2022+

- Refine and finalize artefacts built during Phase I based on the review process
- Expand the artefacts to cover new processes, use cases and problems
- Test the artefacts in reference implementations before they can be adopted as standards
- Bring in standards development organizations for the accreditation of standards
- Develop a maturity model to help countries and programs adopt the standards
- Training and dissemination for wider adoption

PHASE 1 WILL FOCUS ON THE FOLLOWING ARTEFACTS

Starting with foundational artefacts that are perceived to be high priority in most countries – tell us if these are the right ones! As the initiative is being implemented in an agile mode, listing and prioritizing will be responsive to collective feedback

Legal (data protection)

- Data protection

Organizational (Processes)

- Process architecture (overall components across different program types)
- Process deep-dives (e.g., registration, payments)
 - Define minimum standards and best practices for workflow design and functional requirements
 - Define interoperability scenarios/use cases

Semantic (Data Standards, metadata)

- Data dictionary
- Data management and data governance

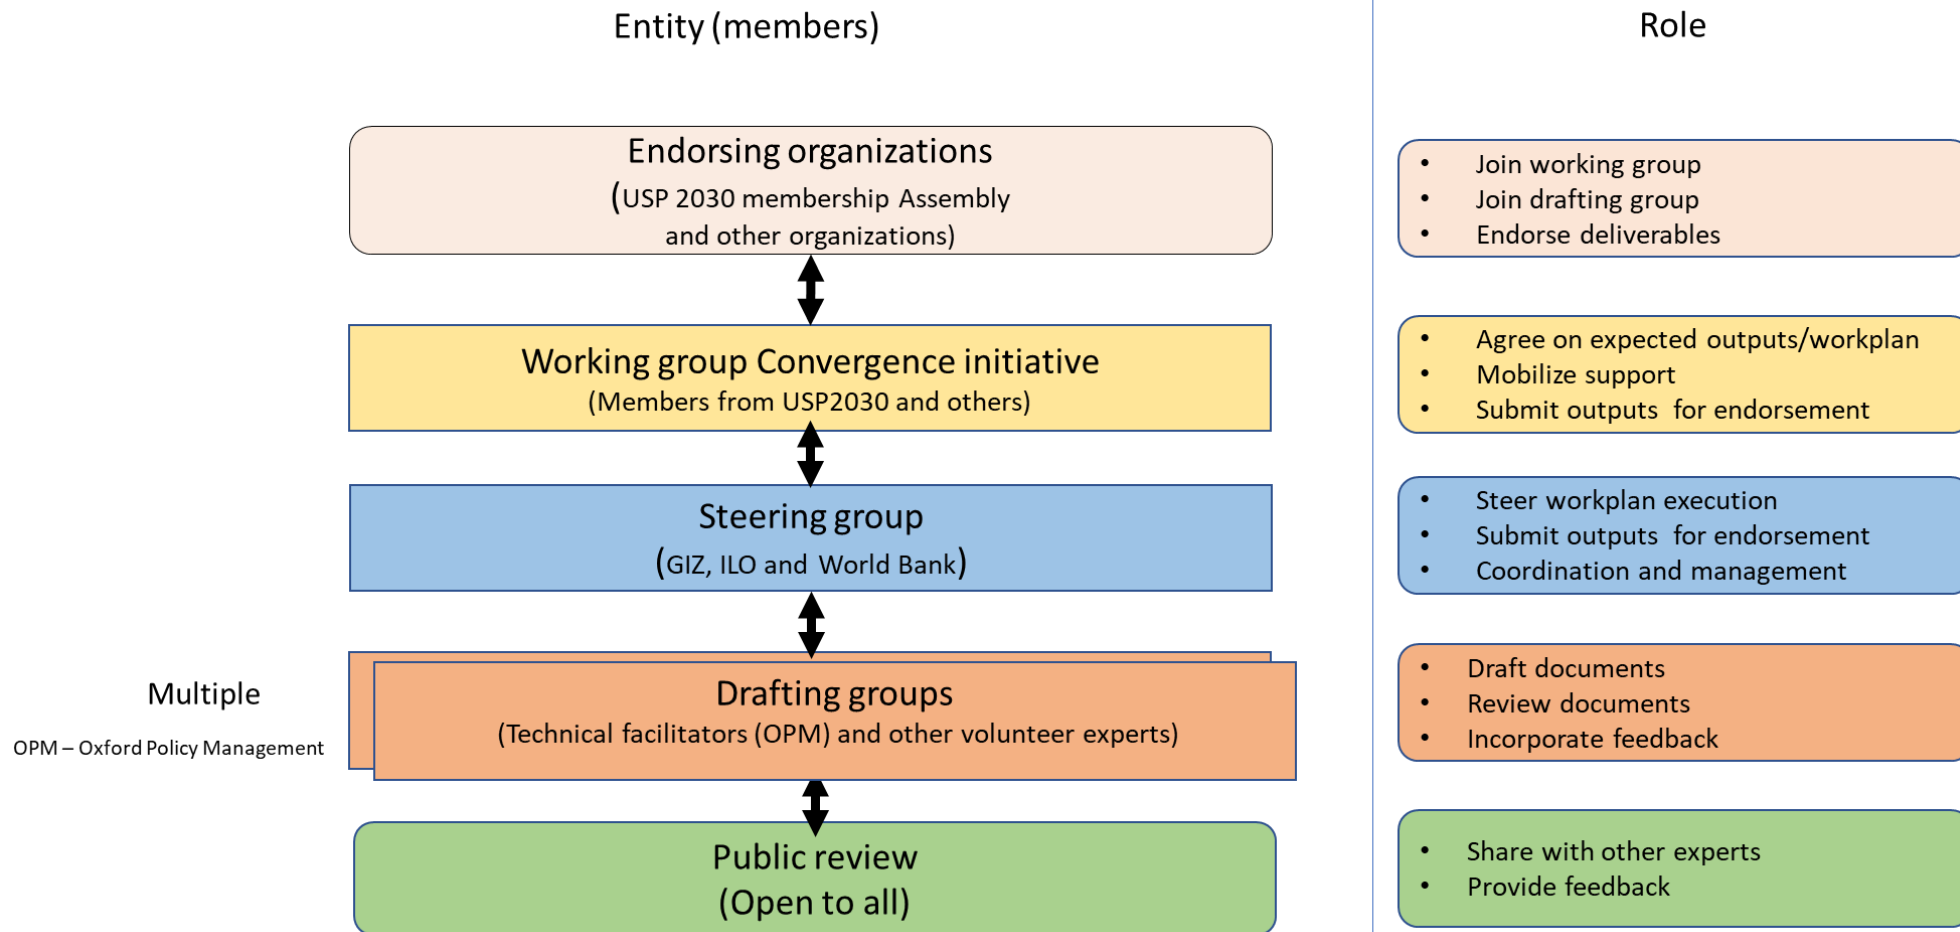

Technical standards

- API's /web services
- Technical standards e.g., biometric, digital signature, encryption

Cross cutting

- Principles to guide the development of digital solutions

COLLABORATION STRUCTURE

- ✓ **Support** the process of **consensus building and harmonization of standards.**
- ✓ **Spread awareness** about the initiative
- ✓ **Promote** adoption of **standards and other outputs**
- ✓ **Adopt the standards and other outputs** in your SP projects and share **feedback**

Participate in Phase 1 (Sept-Dec 21) in Drafting Groups

Group 1 : Principles

Group 2 : Process standards

Group 3 : Data standards

Group 4 : Technical Standards

Levels of participation

Level 1: Share existing materials

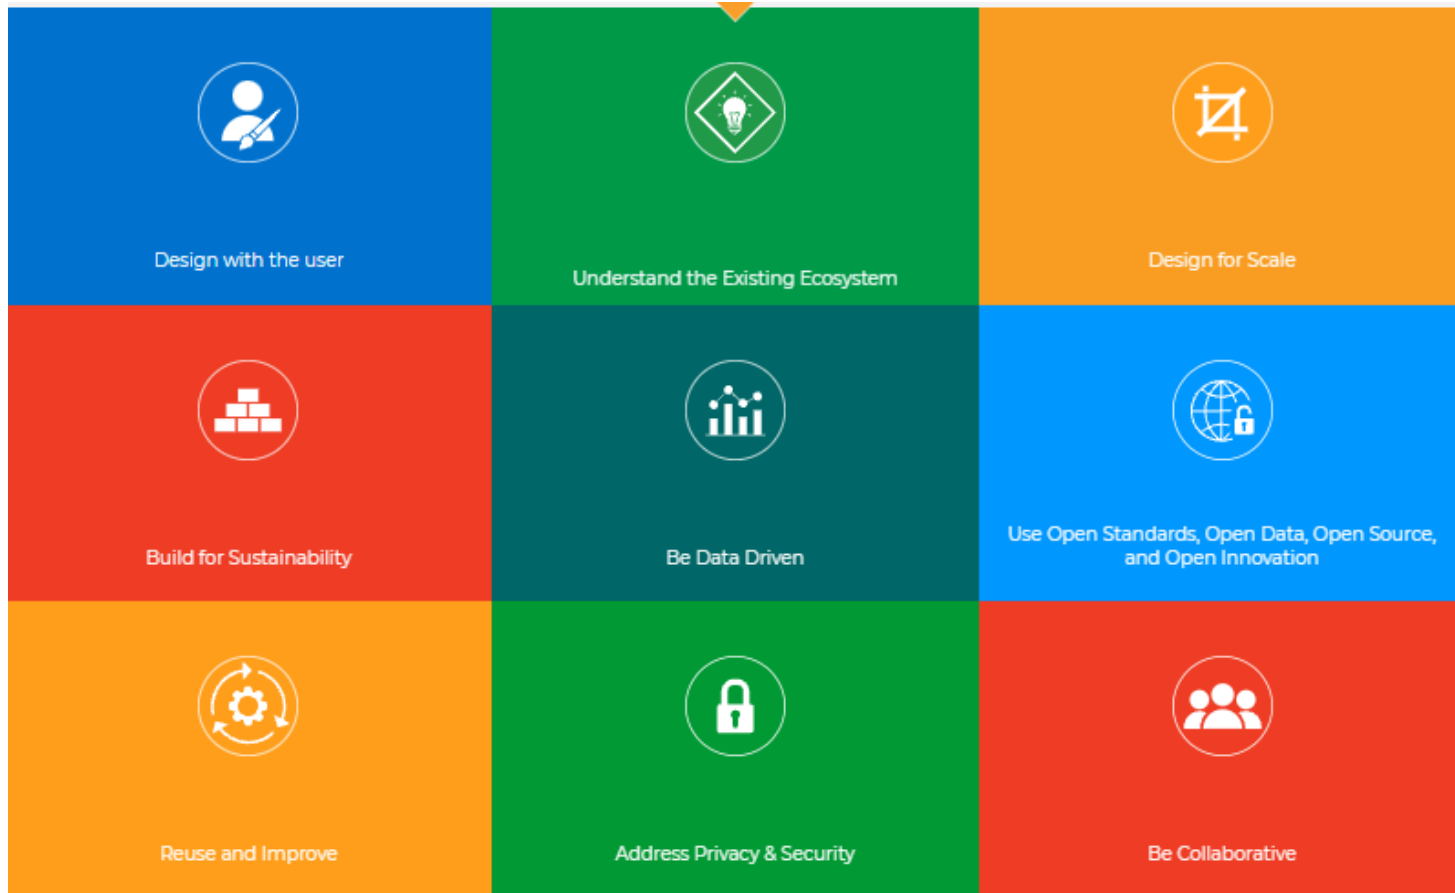

Level 2: Review outputs

Level 3: Join group discussions and validation workshops

Level 4: Drafting standards and guidelines alongside facilitators

workstream on data protection

How could data protection be implemented into SP programs?

- Journey started in 2020
- Long process to develop a guideline
- group discussions and validation workshops
- Review process
- It will be published in January.

IMPLEMENTATION GUIDE
**Good Practices for Ensuring Data Protection and
Privacy in Social Protection Systems**

A guide for practitioners working and advising
in low and middle-income countries

Commissioned by GIZ's Sector Initiative Social Protection
Drafted by Ben Wagner, Carolina Ferro,
Jacqueline Stein-Kaempfe

September 2021

How could data protection implemented into SP programs?

17

PART I : Personal data protection and privacy

- What is personal data protection and privacy?
- International and regional data protection and privacy instruments
- Key terms you should know

1. Personal data protection and privacy

1.1. What is personal data protection and privacy?

Privacy of individuals' **personal data** is an essential element of the right to privacy. This element is called **data privacy** and is increasingly relevant to people's lives.

Since the invention of computers, our personal information is increasingly processed through digital means and moves in seconds through systems around the world, becoming sometimes more challenging to protect than our homes or our letter correspondence.⁴ In this context, the concept of **personal data protection** has gained importance in realising the right to (data) privacy.

Data privacy and data protection are intrinsically linked. In this Implementation Guide the term '**personal data protection and privacy**' will be used to refer to the appropriate and permissioned use, governance, and protection of personal data.

Box 1- The right to privacy as a fundamental human right

Privacy is a fundamental human right that recognises the right of individuals to be free from arbitrary or unlawful interference with matters of personal nature (such as their body, family, home, correspondence, property, thoughts, feelings, personal information), or unlawful attacks on their honour and reputation. It is enshrined in several international human rights treaties and documents, widely ratified by states, contained in many conventions at the regional level, as well as national constitutions and bills-of-rights.

Privacy is essential to our autonomy and the protection of human dignity. It recognises that there is a need to protect ourselves and society against arbitrary and unjustified use of power, by reducing what can be known about us and done to us and shielding ourselves from others who may wish to exercise control over us.

⁴ UN General Assembly, Resolution 73/179, 2018, Resolution 42/15, 2019, and Resolution 75/176, 2020.

How could data protection implemented into SP programs?

25

PART II: Why is personal data protection critical for social protection programmes?

- Social protection and personal data
- Why is data protection needed in social protection?
- Main stakeholders and responsibilities
- Digital technologies increase the urgency of data protection
- There is no contradiction between the right to (data) privacy and the right to social protection

2. Why is personal data protection critical for social protection programmes?

2.1. Social protection and personal data

Social protection has slightly different meanings for different institutions. For example, the SPIAC-B defines social protection as:

"Social protection encompasses the set of policies and programmes aimed at preventing or protecting all people against poverty, vulnerability and social exclusion, throughout the lifecycle, with a particular emphasis on vulnerable groups. Social protection includes social assistance, social insurance, and labour market interventions. It can be provided in cash or in-kind, through non-contributory and contributory schemes, and by building human capital, productive assets, and access to jobs."⁹

Furthermore, social protection is a human right,¹⁰ and social protection programmes and policies support individuals and societies with risk management. Therefore, social protection programmes include instruments to improve resilience, equity and opportunity.¹¹ Social protection interventions include various types, such as categorical programs for child allowances or social pensions, conditional and unconditional cash transfers, unemployment and disability assistance and insurance, active labour market programs, employment services, training services, social and social work services.¹² These components vary from country to country, and programmes are often government-owned. Social protection programmes usually target poor, marginalised or vulnerable groups to increase the presence and effectiveness of safety nets.¹³ However, depending on the programme, different population groups are intended, like children, the elderly, low-income families, the

How could data protection implemented into SP programs?

PART III Good international practice of data protection and privacy

- 1. Data protection and privacy standards
- 2. Data processing principles
- 3. Data subject rights
- 4. Accountability, oversight and enforcement
- 5. International data sharing
- 6. Sensitive personal data

How could data protection implemented into SP programs?

Principles

Data protection works through a set of guiding principles related to the processing of personal data.

They are interrelated and overlap. It is essential to treat them together, as a whole.

How could data protection implemented into SP programs?

Individual's data rights

What are the main rights to be considered?

1. Right to information
2. Right to access
3. Rights to rectify and erasure
4. Right to object
5. Right to data portability
6. Rights related to profiling and automated decision making
7. Right to an effective remedy
8. Right to compensation and liability

How could data protection implemented into SP programs?

PART IV: How to implement data protection and privacy into social protection programmes?

- 1. How to promote and adopt standards for data protection and privacy?
- 2. How to conduct a data protection impact assessment (DPIA) and ensure privacy by design?
- 3. How to apply the data protection and privacy standards to social protection programmes?
- 4. How to work with providers of digital technologies?

Box 27 - Checklist of Good Practices: Lawfulness, fairness, and transparency principle

- Determine the legal basis for each processing activity relating to a specific purpose
- Obtain and process personal data with a lawful basis, fairly and in a transparent manner
- Ensure transparent and fair information and communication with data subjects by clearly informing them, at the time of data collection, on how, why and when their personal data is being processed, both where they have provided this directly to a controller and where the controller has obtained it from another source
- Inform data subjects about their data rights
- Guarantee that any information and communication relating to the processing of personal data is easily accessible, legible, understandable, and adapted to the relevant data subjects.
- Ensure that the data subjects' consent is informed, freely given and specific. In the case of processing sensitive personal data, consent should also be explicit. It should be possible to withdraw consent at any time. Any exceptions where obtaining consent is not possible should be very limited, requiring heightened levels of transparency, only applied on an individual case-by-case basis, and another legal and legitimate basis for personal data processing is required.
- Offer data subjects alternatives that will allow them to continue receiving assistance should they not provide or object to the programme's processing of their personal data, especially in the case of sensitive personal data.

How could data protection implemented into SP programs?

PART V: Boxes

- Definitions and explanations
- Checklist of good practices
- Implementation tools
- Examples

Box 6 - Legal bases for processing personal data

According to the international and regional data protection and privacy frameworks, the legal bases for processing personal data may include the following.⁴⁵ The processing shall be lawful only if and to the extent that at least one of them applies:

1) Public interest: Public interest is the appropriate legal basis when the processing of personal data is necessary to exercise official authority or a task in the public interest and the task has a basis in law. Public interest grounds could be the administration of justice, public health and social security, the prevention, investigation, detection and prosecution of criminal offences, and the execution of criminal penalties, the enforcement of civil law claims, among others. For international organisations, the legal basis of public interest applies when the activity in question is part of a humanitarian mandate established under national or international law or is otherwise an activity in the public interest laid down by law.⁴⁶

2) Vital interests: The processing is necessary to protect the vital interests of a data subject or another person (i.e., protect someone's life, integrity, health, dignity, or security). In the case of vital interest, it is necessary that this legal basis is accompanied by sufficient elements to consider that, in the absence of the personal data processing, the individual could be at risk of physical or moral harm.

3) Legal obligation: The processing is necessary for compliance with a legal obligation to which the controller is subject (not including contractual obligations). It is not necessary that this legal basis expressly permits specific data processing activities, such as data collection. For example, a social protection law may oblige a specific domestic authority to provide assistance to applicants which provide evidence of being under a poverty level. In this case, the authority is required to collect the data to assess those conditions and to ensure delivery of the benefits to the targeted persons, to comply with its legal obligation.

4) Informed consent: Consent indicates the data subjects' agreement to the processing of personal data relating to them for a specific purpose. Where the processing is based on consent, the controller shall be able to demonstrate that the data subject has consented to the processing of his or her personal data. If the data subject does not provide consent, the data cannot be processed on this legal basis. Consent won't always be the most appropriate legal basis.
